Times of separation have ended – we only can reach more by co-operation. More in terms of well-being in social and economic sense, in “standard of living”. Science is the best example of mutual understanding of this need. Even during the times of old war, there were contacts among the best researchers of the both sides of the wall. It is flourishing now, but we have to water the flower as much as we can. Co-operation is not possible without communication. That is why all countries – as far as I know – put ICT on their lists of top priorities. However, communication itself, and its developments, is not enough. We should take into consideration not only speed of information, but also its contents. How could we reach more by using the newest means of ICT? What to do on national level, what should be done on bilateral basis, what would be the task for multilateral consideration? What is the role of individuals, institutions, what is the role of the state authorities? What about issues challenging the mankind for which the scope of a problem and its solution is by far over ability of a single country? This short presentation is just a small contribution to the above questions.
